High Yield Histopathology

Synopsis

High-Yield Histopathology reviews the relationships of basic histology to the pathology, physiology, and pharmacology of clinical conditions that are tested on the USMLE Step 1 and seen in clinical practice. The book includes case studies that prepare students for the clinical vignette questions on the USMLE Step 1 along with numerous illustrations, clinical images, and tables for reference and study. This edition includes additional information on male and female tumours and breast cancer, new images of clinical conditions, and several new tables, line drawings, and graphs. The figure legends and text are more succinct, and the Clinical Considerations sections are more consistently organized - characteristics, symptoms, diagnosis, and treatment. Features: NEW! addition of information on male and female tumours to Chapters 26 and 27; NEW! additional information on breast cancer in Chapter 26; NEW! approximately 15 new images of clinical conditions; NEW! approximately 5 additional tables and modifications to other tables; NEW! approximately 5 new line drawings or graphs; NEW! improved, more consistent organization for the Clinical Considerations: Characteristics, Symptoms, Diagnosis & Treatment; NEW! shortened figure legends as well as reductions in text to be more concise (high-yield) & correlation of basic histology with pathology and physiology concepts.

Customer Reviews

I like the book details which you might skip some of them; but in general this special book is very

useful when you want details on blood, ear, eye and cytokines. It is informative especially if combined with Kaplan lectures. 5 stars plus for Friendly and High Yield Editors for Histopathology

it is a very good book...concise....you should have a look at it first before buying it.....might or might not meet your expectations for me, it worked because I am also using another book which is BRS histology

This book is good, because it has integrated different subjects, such as, physiology, pharmacology, pathology, etc. However, some of the high yield books including this one are becoming more like the "board review series", they are becoming too detailed. People won't sue them if those books miss a few details, people are reading this book and other high yield because they want to get the fundamental, basic idea. They don't want to read all the details. There are some mistakes and problems. I shall list them here, I am sure that the author or the publisher will read this.

1. on page 281, it explains why some women have pink nipples, it has "in children and blonde individuals." The word blonde is certainly not correct. For one thing, there are women who dye their hair to blond, that doesn't mean that their nipples will become pink. Some white women don't have light skin while some Asians and Hispanics do have light skin. So the proper word should be light skinned individuals.
2. Chapter 27: male reproductive system, on page 296, it actually included "female urethra" which should be put into the urinary system.
3. some of the chapters are definitely too long. For example, urinary system starts at page 211, ends at page 241. For "proximal convoluted tubule," it has 12 important points, that is just too much. Can the author himself recite those 12 points himself?
4. The diagnosis for some of the case study are too long. For example, on page 209, the diagnosis is one single paragraph on one and half pages. The author should separate the answer into several paragraphs to make it a little easy to read.

This book is way too big to call itself high-yield. Like many of the newer High-Yield books, the level of detail is far beyond what is necessary for Step 1. I wish I had bought a used, older edition instead.
